## Energy Storage

1. Energy Storage in Power Systems

Assoc. Prof. Hrvoje Pandžić

## Power System

## Daily Load Curve

## $\square \square \square$

## Daily Load Curve

## Load Forecasting

$\square$ Based on historical data
$\square$ Relatively simple task
$\square$ Error within 5\%
$\square$ Temperature has the greatest influence (HVAC)
$\square$ Influence of certain specific events

## Load Forecasting

- 1998 FIFA World Cup Semi-Finals: France - Croatia, Wednesday 8th July 1998

Niko Mandić, „What connects football and power system?," EGE 3/2008, pp. 44-50

## Load Forecasting

$\square 1998$ FIFA World Cup Semi-Finals: France - Croatia, Wednesday 8th July 1998

Niko Mandić, „What connects football and power system?," EGE 3/2008, pp. 44-50

## Load Forecasting

Ilustracija 5 : Detalj originalnog zapisa NG (Engleska) potrošnje električne energije za vrijeme nogometne utakmice EngleskaArgentina 30.06 1998. godine u vremenu 19:10 do 23:30. Rezolucija vremenske ose je 10 minuta. Plavi grafikon prikazuje potrošnju srijeda 23.06. 1998. godine crvenom bojom grafikon potrošnje srijeda 30.06. 1998.godine sedam dana kasnije.

## Renewable Energy Sources (RES)

$\square$ Wind energy is the most popular renewable energy source
$\square$ Wind power capacity of 744 MW is expected to be achieved within a few years
$\square$ Wind power capacity of 575 MW is already in operation
$\square$ Problematic location
$\square$ Production factor around 25\%

## Renewable Energy Sources (RES)

ㅁ 16 out of 19 wind farms, whose installed capacity is $75 \%$ of the overall wind farm capacity in Croatia, is located in a square $110 \times 70$ km ${ }^{2}$

## Renewable Energy Sources

Net load - March 31

## Why RES?

## $\square$ Europe imports: <br> ■ 90\% oil <br> - 66\% gas <br> ■ 42\% coal <br> - $40 \%$ uranium

## Why RES?

$\square$ System flexibility:

- Technical: system's ability to quickly and appropriately respond to sudden changes in production and consumption in the system.
- Market: market's ability to enable trading of electricity at the appropriate time scale in order to avoid imbalance.
$\square$ Non-dispachable RES reduce the flexibility of the system :
- Unpredictability: increased demand for reserve in the system.

■ Variability: increased need for flexible units.

## Power System

$\square$ Frequency 50 Hz
$\square$ The production follows consumption
$\square$ Generators provide reserve
$\square$ Increased price of reserve due to uncertainty of electricity production from RES

## Potential Solutions

| Technology | Congestion | Electricity <br> production | Reserve <br> provision | Impact on <br> emissions |
| :--- | :--- | :--- | :--- | :--- |
| FACTS devices |  |  |  |  |
| Gas power plants |  |  |  |  |
| Grid <br> reconfiguration |  |  |  |  |
| Energy storage |  |  |  |  |

## Potential Solutions

| :--- | :---: | :---: | :---: | :---: |
| FACTS devices | + | - | - | $-/+$ |
| Gas power plants | - | + | + | - |
| Grid <br> reconfiguration | + | - | - | $-/+$ |
| Energy storage | + | $-/+$ | + | $-/+$ |

## Energy Storage in Power Systems

$\square$ Balance between the production and consumption within a longer period of time
$\square$ Increased RES share
$\square$ Energy storage reduces control requirements on power plants
$\square$ Energy storage provides flexibility
$\square$ Energy storage is used for corrective N - 1 security

## Relatively Recently ...

F=3 ... and Today

$\square$ Benefits:

- Levelling of the load curve
- Ancillary services (frequency containment reserve "primary reserve", frequency restoration reserve "secondary reserve", replacement reserve - "tertiary reserve" and voltage stability)
- Reduction of congestion
- Greater utilization of wind and solar energy
- More cost-effective operation of the system (less fuel, less power plant cycling, ...)
- Transition from the preventive to the corrective N-1 security operation

## Energy Storage in the World

## $\square$ Stored / delivered electricity:

■ USA 2.5\%
■ Europe 10\%
Pump storage trends

- Japan 15\%

## Energy Storage in California

## $\square$ California

■ CPUC requires installed capacity of 1.325 MW in storage by 2020 (PG\&E 580 MW, SCE 580 MW, SDG\&E 165 MW)

- Energy storage will be connected to the three levels:
$\square$ Transmission network
$\square$ Distribution network
$\square$ End-users

## Energy Storage in California

|  |  | $\mathbf{2 0 1 4}$ | $\mathbf{2 0 1 6}$ | $\mathbf{2 0 1 8}$ | $\mathbf{2 0 2 0}$ | Total |

## Energy Storage in the World

$\square 27$ MW during 15 min NiCd - Fairbanks, AL (2003)
$\square 20$ MW during 15 min flywheel - Stephentown, NY (2011)

- 32 MW during 15 min Li-lon - Laurel Mountain, WV (2011)
$\square 36$ MW during 40 min Lead Acid - Notrees, TX (2012)
$\square 8$ MW during 4 h Li-Ion - Tehachapi, CA (2014)
$\square 25$ MW during 3 h Flow bat. - Modesto, CA (2014)
$\square 5$ MW during 1 h Li-lon - Schwerin, Germany (2014)
$\square$....
$\square$ Interactive map available at http://www.energystorageexchange.org/projects

## Energy Storage in Alaska

$\square \quad 27$ MW during 15 min NiCd Fairbanks, AL (2003)
$\square$ Consumption on wide area
$\square$ Back-up, N-1 supply
$\square$ Rotating reserve
$\square$ Low winter temperatures

- 26 MW through 15 min or 40 MW through 7 min

## Energy Storage in Germany

$\square$ Schwerin, Germany upgrade 2016
$\square$ WEMAG north Germany, 15 MW and 15 MWh
$\square$ Primary frequency regulation, black start
$\square$ 53.444 Samsung lithium mangan oxid cell

## Energy Storage in Italy

## Power Intensive

- Mission: increase safety of grid
- Total Power: $\approx \mathbf{4 0} \mathrm{MW}$
- Solutions: Li-Ion, Zebra, Flow, Supercaps
- Number of sites: $\mathbf{2}$
- Investment Size: 93 €mln;

## Energy Intensive

- Mission : reduce grid congestions
- Total Power: $\approx 35 \mathrm{MW}$
- Solution: $\mathrm{NaS}_{\text {Sodium Sulfur }}$
- Number of sites: 3
- Investment Size: 160 €mln;

Site 1: Ginestra

- Total Capacity: $\approx 12 \mathrm{MW}$
- Status: operational

Site 2 Flumeri

- Total Capacity: $\approx 12 \mathrm{MW}$
- Status: operational

Site 3 Scampitella

- Total Capacity: $\approx 10.8 \mathrm{MW}$
- Status: operational
- Total Power: $\approx 6,8 \mathrm{MW}$
- Status: operational $\approx 5,1 \mathrm{MW}$
under construction $\approx 0,45 \mathrm{MW}$
tender to be submitted $\approx 1,25 \mathrm{MW}$

## PHASE II: 24 MW

Casuzze and Codrongianos: to be initiated

## Electricity Bill Components

$\square$ Energy payment (high and low tariff)
$\square$ Distribution and transmission network charge
$\square$ Charge for meter-reading
$\square$ Charge for incentivizing RES
$\square$ Power factor charge
$\square$ Capacity charge

## Load Diagram

$\square$ Energy storage can reduce the cost of electricity supply

## Optimal Load Profile

$\square$ Optimal load profile under different peak load policies when considering only peak load payments
$\square$ The original load profile is denoted with black line
$\square$ If peak load payments apply to all the hours of the day (policy 1), the optimal load profile is flat, since it incurs minimum peak load payments
$\square$ However, if peak load payments are applicable only to the high-tariff hours (policy 2), the optimal load profile is zero during the hightariff period, since it avoids any peak load payments

## Optimal Battery Operation

$\square$ Load, battery storage charging and discharging quantities and net load when peak load payments are applicable to all hours
$\square$ Colored background denotes the high-tariff periods

## Optimal Battery Operation

$\square$ Load, battery storage charging and discharging quantities and net load when peak load payments are applicable to only hightariff hours

## Optimal Investment in Energy Storage

$\square$ Optimization results as investment decision in the energy storage

| Price $\$ / k W$ | 200 | 250 | 300 |
| :--- | :---: | :---: | :---: |
| Price $\$ / k W h$ | 100 | 150 | 200 |
| Installed capacity (kW) | 95.38 | 5.76 | 0 |
| Installed capacity (kWh) | 836.81 | 7.58 | 0 |
| Annual cost (\$) | 253,848 | 256.690 | 256.695 |
| Savings (\%) | $1.12 \%$ | $0 \%$ | $0 \%$ |

Electricity higher rate: $0.93 \mathrm{kn} / \mathrm{kWh}$
Electricity lower rate: $0.43 \mathrm{kn} / \mathrm{kWh}$
Active power: $29.50 \mathrm{kn} / \mathrm{kW}$

## Energy Storage Technologies

Energy Storage Systems by Duration and Power

## Energy Storage Technologies

$\square$ Pumped hydropower plants

$\square$ Batteries
$\square$ Flywheels
$\square$ Ultracapacitors
$\square$ Fuel cells (hydrogen)
$\square$ Heat pump
$\square$ Demand response

## Pumped Hydropower Plants

$\square$ A hydraulic turbine converts kinetic energy of falling water into mechanical energy
$\square$ A generator converts the mechanical energy from the turbine into electrical energy
$\square$ Water is pumped into the upper reservoir during periods of low consumption and significant production of other plants

$$
\begin{aligned}
& P=\rho \cdot g \cdot h \cdot Q \cdot \eta_{T} \cdot \eta_{G}(\mathrm{~W}) \\
& P \approx g \cdot h \cdot Q \cdot \eta_{T} \cdot \eta_{G}(\mathrm{~kW})
\end{aligned}
$$

## Pumped Hydropower Plants

Pumped Hydropower Plants in Europe
$\square$ Pumped HPP total installed capacity in the world is around 104 GW
$\square 44$ GW in Europe:

- Germany
- Italy
- France
- Spain

## Pumped Hydropower Plants in Europe

| Europe | 44 GW |  |  |
| :--- | :--- | :--- | :--- |
| Austria | 4.4 GW | Luxembourg | 1.1 GW |
| Belgium | 1.3 GW | Norway | 1.4 GW |
| Bulgaria | 0.9 GW | Poland | 1.4 GW |
| Croatia | 0.3 GW | Portugal | 1.0 GW |
| Czech Rep. | 1.1 GW | Serbia | 0.6 GW |
| France | 4.3 GW | Slovakia | 0.9 GW |
| Germany | 6.7 GW | Spain | 5.3 GW |
| Greece | 0.6 GW | Sweden | 0.1 GW |
| Ireland | 0.3 GW | Switzerland | 1.8 GW |
| Italy | 7.5 GW | UK | 2.7 GW |

Pumped Hydropower Plants in the World

| North America |  | 22.4 GW |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Canada | 0.2 GW |  | SAD | 22.2 GW |
| Central and South America 1 GW |  |  |  |  |
| Argentina | 1 GW |  |  |  |
| Africa |  | 2 CW |  |  |

| Asia and Oceania |  | 33 CW |  |  |
| Australia | 1 GW |  | South Korea | 4 GW |
| Japan | 25 GW |  | Taiwan | 3 GW |

## CAES

$\square$ The air is stored in underground tanks, caves and caverns
$\square$ The stored energy is released during periods of high load
$\square$ The operation of the CAES is based on some of the following thermodynamic processes:

- diabatic (system exchanges energy with the environment)
- adiabatic (system does not exchange energy with the environment)
■ isothermal (constant temparature)

## CAES

$\square$ Standard gas turbines are used with exception that the compression of the combustion air is independent of the standard process of the gas power plant
$\square$ Compression phase uses about half the power of the gas turbine and therefore CAES enables the production of twice more electricity with the same amount of gas
$\square$ Due to the reduced gas consumption, $\mathrm{CO}_{2}$ emissions have been reduced by 30-6\%
$\square$ The process efficiency is around $42 \%$ without the use of waste heat and around $55 \%$ with the use of waste heat

## CAES

## Batteries

$\square$ Battery is a device that coverts chemical energy of its active materials directly into electrical energy through an electrochemical redox reaction
$\square$ In case of rechargeable batteries, the process is reversible
$\square$ Batteries have an efficient energy conversion since they use electrochemical process to convert chemical energy into electricity
$\square$ Although the term battery is often used, the basic unit in which the reaction occurs is known as battery cell
$\square$ Battery consists of multiple cells connected in series and parallel, depending on the desired voltage and capacity

## Batteries

Full
$\square$ Battery types:
■ Lead-acid

- Nickel-cadmium
- Nickel-metal hybrid
- Lithium-ion
- Zinc-oxide

■ Vanadium-redox (flow battery)

## Flywheels

$\square$ Flywheel is a rotating mechanical device used to store mechanical (rotational) energy
$\square$ Flywheel resists changes in

$$
\cdot E_{k}=\frac{1}{2} I \omega^{2}
$$ rotational speed by its moment of inertia

$\square$ The amount of energy stored in flywheel is proportional to the square of its rotational speed
$\square$ External torque is used to deliver energy to flywheel and in that case the flywheel acts as a load
$\square$ When flywheel provides energy, it acts as a generator and provides the necessary torque for the load while at the same time its rotational speed is decreasing

## Flywheels

## Design Concept

Single flywheel machine EnWheel ${ }^{\circledR} 60$ with DC Drive

| Lifespan |  |
| :--- | :--- |
| Mechanics | 20 years + (expected) |
| Charge cycles | $100,000+$ |
| Power Electronics | $\pm 10$ years replacement time |

| Operational Capacity |  |
| :--- | :--- |
| Name plate power | 60 kW |
| Effective energy | 3.4 kWh |
| Bi-directional capacity @ 60kW | 65 sec |
| One-directional capacity | 120 sec |

| Electrical Data |  |
| :--- | :--- |
| Input/output voltage | 700 to 750 V DC |
| Maximum voltage | 800 V DC |
| Maximum effective power | 83 kW peak |
| Round trip efficiency (typical) | $90 \%$ |
| Response time | 10 ms |

## Capacitors

$\square$ A capacitor consists of two metal plates, i.e. conductors (typically aluminium), separated by a dielectric medium (air, plastics or ceramics)
$\square$ During charging, the electrons pile up on one conductor and go away from the second
$\square$ Charge Q is proportional to voltage V and capacitance C , whereas energy is proportional to capacitance and the square of voltage

$$
\mathrm{Q}=\mathrm{C} \times \mathrm{V} \quad \mathrm{E}=\frac{1}{2} \mathrm{CV}^{2} \quad \mathrm{C}=\varepsilon \frac{\mathrm{A}}{\mathrm{~d}}
$$

$\square$ Electrons want to reach the positive side, but they can not pass through the insulator - energy is stored in electric field

## Ultracapacitors $C=\varepsilon \frac{A}{d} \quad E=\frac{1}{2} C V^{2}$

$\square$ Ultracapacitors are another type of capacitor which is constructed to have a large conductive plate, called an electrode, surface area (A) as well as a very small distance (d) between them.
$\square$ The ultracapacitor uses a liquid or wet electrolyte between its electrodes making it more of an electrochemical device
$\square$ Still, no chemical reactions are involved in the storing of its electrical energy.
$\square$ It remains an electrostatic device storing its electrical energy in the form of an electric field between its two conducting electrodes

## Ultracapacitors

$\square$ Electrodes $\rightarrow$ carbon; porous membrane $\rightarrow$ separator keeps electrodes apart, blocks electrons, leaks ions,
$\square$ Electrodes and separator are impregnated with electrolyte
$\square$ Voltage 1-3 V
$\square$ Capacitance hundreds of farads

## Fuel Cells

$\square$ A device that produces electricity through a chemical reaction, requires a continuous source of fuel and oxygen
$\square$ The reactions that produce electrical energy takes place on the electrodes
$\square$ Fuel cells also contains an electrolyte carrying ions from one electrode to the other, and a catalyst which accelerates the reaction at the electrodes
$\square$ Electricity <-> hydrogen as a fuel

## Storing Thermal Energy

$\square$ Boiler
$\square$ Refrigerator
$\square$ Building (HVAC)
$\square$ In district heating
$\square$ Molten-salt technology

## Storing Thermal Energy

$\square$ Molten-salt technology
$\square$ Molten salt is stored at $566^{\circ} \mathrm{C}$ until electricity is needed

## Demand Response

$\square$ Load shifting
$\square$ Stored thermal/cold energy, pressure (water supply), etc.
$\square$ Again, it stores energy through different energy vectors
$\square$ Multi-energy arbitrage, energy vector switching

## Demand Response

$\square$ Load shifting
$\square$ Mainly based on the stored thermal energy, pressure (water supply), etc.

Up reserve

## Down reserve

The length of the arrow corresponds to the possible duration of the service

## How Can Energy Storage Earn Money (or Save)?

$\square$ Large-scale energy storage is connected to the transmission network
$\square$ Medium-scale energy storage is connected to distribution network
$\square$ Small-scale energy storage is connected by the enduser behind the meter

## Energy Storage in the DayAhead Market

$\square$ Prices at CROPEX-u on Monday, February $26^{\text {th }} 2018$ (Eur/MWh)

| Hour | Price | Hour | Price | Hour | Price |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 40,12 | 9 | 71,77 | 17 | 64,23 |
| 2 | 42,40 | 10 | 72,03 | 18 | 70,49 |
| 3 | 42,32 | 11 | 64,39 | 19 | 81,21 |
| 4 | 40,03 | 12 | 59,28 | 20 | 76,01 |
| 5 | 39,97 | 13 | 53,08 | 21 | 59,95 |
| 6 | 43,05 | 14 | 54,51 | 22 | 57,63 |
| 7 | 56,45 | 15 | 53,07 | 23 | 45,00 |
| 8 | 77,53 | 16 | 59,00 | 24 | 45,63 |

## Energy Storage in the DayAhead Market

$\square$ In what way the storage should be charged and discharged in order to maximize profit? The rated power of the storage is 1 MW , energy capacity is 1 MWh , and efficiency is 0.9 .

| Hour | Price | Hour | Price | Hour | Price |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 40,12 | 9 | 71,77 | 17 | 64,23 |
| 2 | 42,40 | 10 | 72,03 | 18 | 70,49 |
| 3 | 42,32 | 11 | 64,39 | 19 | 81,21 |
| 4 | 40,03 | 12 | 59,28 | 20 | 76,01 |
| 5 | 39,97 | 13 | 53,08 | 21 | 59,95 |
| 6 | 43,05 | 14 | 54,51 | 22 | 57,63 |
| 7 | 56,45 | 15 | 53,07 | 23 | 45,00 |
| 8 | 77,53 | 16 | 59,00 | 24 | 45,63 |

## Energy Storage in the Reserve Market

$\square$ Batteries provide secondary/tertiary reserve:

- It is possible to provide capacity, but what happens when this capacity is activated?

## Energy Storage in the Reserve Market

$\square$ Batteries provide secondary/tertiary reserve:
■ It is possible to provide capacity, but what happens when this capacity is activated?

Energy Storage in the Distribution Network

## Energy Storage in the Distribution Network

$\square$ Energy storage in the distribution network is able to participate in all the markets the same as storage in the transmission network, but it must be done by means of aggregators/virtual power plants/balancing group
$\square$ Virtual power plant (VPP) represents a dislocated flexible power plants/loads who act as a larger "central unit"/ conventional power plant

## Behind-the-Meter Energy Storage

$\square$ Savings on energy consumption (shifting the consumption from high tariff to low tariff)
$\square$ Savings on the monthly peak load charge
$\square$ The ability to provide ancillary services through aggregators
$\square$ Microgrid concept

## Microgrid

## $\square$ Unlike virtual power plant, the microgrid has only one metering point

## Microgrid

$\square$ Microgrids are subsystems of the distribution grid, which comprise generation capacities, storage devices, and controllable loads, operating as a single controllable system either connected or isolated from the utility grid.
$\square$ The control system of the microgrid automates and optimizes the operation of energy sources (conventional generators and RES), storage devices and controllable loads
$\square$ Optimal operation of a microgrid involves coordination of all the microgrid elements (minimization of the overall microgrid operating costs or emissions)

## Microgrid Example

## Optimal Microgrid Operation

$\square$ The central microgrid controller makes a decision based on the optimization model
$\square$ The model looks for optimal solution by taking into account technical limitations, current conditions in the microgrid and microgrid parameters
$\square$ The microgrid controller must take decisions about:

- How much electricity each dispatchable units should generate
- When should storage device be charged or discharged
- Curtailment schedule
$\square$ Decisions are being implemented using the control and measurement system
$\square$ Optimization is performed periodically

# Microgrid’s Dispatchable Components 

## $\square$ Conventional generators:

- Maximum production (kW)
- Minimum production (kW)
- Ramp rate (kW/min)
- Minimum up time (min)
- Minimum down time (min)
- Operating costs (Eur/kW)
- Start-up costs (Eur)

## Microgrid's Dispatchable Components

$\square$ Energy storage:

- Maximum charging/discharging power (kW)
- Storage energy capacity (kWh)
- Minimum energy level of the storage (kWh)
- Cycle efficiency
- Degradation
$\square$ Controllable loads
■ Efficiency level?
$\square$ Lightning: 100\% -> 0\%
$\square$ Air conditioners (home): 100\% -> 100 - 130\%
$\square$ HVAC: $100 \%$-> $50-130 \%$
$\square$ Industry: 100\% -> $100-120 \%$

## Optimal Microgrid Operation

$\square \quad$ The expected non-dispatchable loading during 6 hour period is given in the table. The microgrid also comprises of two dispatchable units and a controllable load. The first dispatchable unit has rated power 150 kW and operating costs $0,040 € / \mathrm{kWh}$, while the second unit has rated power 150 kW and operating costs $0,060 € / \mathrm{kWh}$. Controllable load has rated power 25 kW . Determine the operation costs in the following cases:

1. Controllable load cannot be controlled.
2. Controllable load is lightning ( $0 \%$ retrieveal factor) and it is possible to shift $20 \%$ of consumption in each hour, a total of 12.5 kWh during 6 hours.
3. Controllable load is HVAC ( $120 \%$ retrieval factor) and it is possible to shift $20 \%$ of consumption in each hour, a total of 12.5 kWh during 6 hours.
4. Controllable load cannot be controlled, but a battery is included in the microgrid; roundtrip efficiency is 0.9 and battery is

| Hour | Load |
| :--- | :--- |
| 1 | 80 kW |
| 2 | 160 kW |
| 3 | 220 kW |
| 4 | 90 kW |
| 5 | 200 kW |
| 6 | 180 kW | empty at the beginning.

5. Combination of 3 and 4 .
